Polar (pō'lar), *n.* (*Conic Sections*) The right line drawn through the two points of contact of the two tangents drawn from a given point to a given conic section. The given point is called the *pole* of the line. If the given point lies within the curve so that the two tangents become imaginary, there is still a real polar line which does not meet the curve, but which possesses other properties of the polar. Thus the focus and directrix are pole and polar. There are also poles and polar curves to curves of higher degree than the second, and poles and polar planes to surfaces of the second degree.

Polariscope (pō'lar-ī-skōp), *n.* (*Opt.*) A peculiar affection or condition of the rays of light or heat, in consequence of which they exhibit different properties in different directions.

Polariscope (pō'lar-ī-skōp), *n.* (*Opt.*) If a beam of light, which has been reflected from a plate of unsilvered glass at an angle of about 56°, be received upon a second plate of glass similar to the former, and at the same angle of incidence, the light will be readily reflected when the two planes of incidence are parallel to each other, but will not be reflected when the two planes of incidence are perpendicular to each other. The light has, therefore, acquired new properties by reflection from the first plate of glass, and is called *polarized light*, while the modification which the light has experienced by this reflection is called *polarization*. The plane in which the beam of light is reflected from the first mirror is called the *plane of polarization*. The angle of polarization is the angle at which a beam of light must be reflected, in order that the polarization may be the most complete. The term *polarization* was derived from the theory of emission, and it was conceived that each luminous molecule has two poles analogous to the poles of a magnet; but this view is not now held. According to the undulatory theory, ordinary light is produced by vibrations transverse or perpendicular to the direction of the ray, and so distributed as to show no distinction as to any particular direction. But when, by any means, these vibrations are made to take place in one plane, the light is said to be *plane polarized*. If only a portion of the vibrations lie in one plane, the ray is said to be *partially polarized*. Light may be polarized by several methods other than by reflection, as by refraction through most crystalline media, or by being transmitted obliquely through several plates of glass with parallel faces. If a beam of polarized light be transmitted through a crystal of quartz in the direction of its axis, the plane of polarization will be changed

by an angle proportional to the thickness of the crystal. This phenomenon is called *rotatory polarization*. A beam of light reflected from a metallic surface, or from glass surfaces under certain peculiar conditions, acquires properties still more complex, its vibrations being no longer rectilinear, but circular, or elliptical. This phenomenon is called *circular or elliptical polarization*.

Polariscope (pō'lar-ī-skōp), *n.* (*Physic.*) An effect produced upon the plates of a voltaic battery, or the electrodes in an electrolytic cell, by the deposition upon them of the gases liberated by the action of the current. It is chiefly due to the hydrogen, and results in an increase of the resistance, and the setting up of an opposing electro-motive force, both of which tend materially to weaken the current of the battery, or that passing through the cell.

1. The relation or adaptation of one portion to another, or to the whole, as respects magnitude, quantity, or degree; comparative relation; ratio; as, the *proportion* of the parts of a building, or of the body.

5. (*Math.*) (a) The equality or similarity of ratios, especially of geometrical ratios; or a relation among quantities such that the quotient of the first divided by the second is equal to that of the third divided by the fourth; — called also *geometrical proportion*, in distinction from *arithmetical proportion*, or that in which the difference of the first and second is equal to the difference of the third and fourth.

(b) *Proportion* in the mathematical sense differs from *ratio*. *Ratio* is the relation of two quantities of the same kind, as the ratio of 5 to 10, or the ratio of 8 to 16. *Proportion* is the sameness or likeness of two such relations. Thus, 5 is to 10 as 8 to 16; that is, 5 bears the same relation to 10 as 8 does to 16. Hence, such numbers are said to be in *proportion*. *Proportion* is expressed by symbols thus:

$$a : b :: c : d, \text{ or } a : b = c : d, \text{ or } \frac{a}{b} = \frac{c}{d}$$

(b) The rule of three, in arithmetic, in which the three given terms, together with the one sought, are proportional.

Continued proportion, *inverse proportion*, etc. See under CONTINUED, INVERSE, etc. — *Harmonical*, or *Musical proportion*, a relation of three or four quantities, such that the first is to the last as the difference between the first two is to the difference between the last two; thus, 2, 3, 6, are in harmonical proportion; for 2 is to 6 as 1 to 3. Thus, 24, 16, 12, 9, are harmonical, for 24 : 9 :: 16 : 3. — *In proportion*, according as, to the degree that, "In *proportion* as they are metaphysically true, they are morally and politically false." *Burke.*

A wheel with a broad rim, or grooved rim, for transmitting power from, or imparting power to, the different parts of machinery, or for changing the direction of motion, by means of a belt, cord, rope, or chain.

The pulley, as one of the mechanical powers, consists, in its simplest form, of a grooved wheel, called a sheave, turning within a movable frame or block, by means of a cord or rope attached at one end to a fixed point.

The force, acting on the free end of the rope, is thus doubled, but can move the load through only half the space traversed by itself. The rope may also pass over a sheave in another block that is fixed. The end of the rope may be fastened to the movable block, instead of a fixed point, with an additional gain of power, and using either one or two sheaves in the fixed block. Other sheaves may be added, and the power multiplied accordingly. Such an apparatus is called by workmen a block and tackle, or a fall and tackle. See BLOCK. Q.

Q (kü), the seventeenth letter of the English alphabet, has but one sound (that of *k*), and is always followed by *u*, the two letters together being sounded like *kw*, except in some words in which the *u* is silent. See *Guide to Pronunciation*, § 249. *Q* is not found in Anglo-Saxon, *cu* being used instead of *qu*; as in *cwite*, quick; *cwen*, queen. The name (kü) is from the French *ku*, which is from the Latin name of the same letter; its form is from the Latin, which derived it, through a Greek alphabet, from the Phœnician, the ultimate origin being Egyptian.

Etymologically, *q* or *qu* is most nearly related to *c* (*ch*, *sch*), *p*, *g*, and *wh*; as in *quid*, *L. equus*, *ecus*, *horae*, *Gr. ἵππος*, whence *E. equine*, *hippic*; *L. quod* which, *E. what*; *L. aquila*, *E. eagle*; *E. kitchen*, *O.E. kiohene*, *A.S. eocene*, *L. coquina*.

The form of the question is: "Shall the main question be now put?" If the vote is in the affirmative, the matter before the body must be voted upon as it then stands, without further general debate or the submission of new amendments. In the House of Representatives of the United States, and generally in America, a negative decision operates to keep the business before the body as if the motion had not been made; but in the English Parliament, it operates to postpone consideration for the day, and until the subject may be again introduced. In American practice, the object of the motion is to hasten action, and it is made by a friend of the measure. In English practice, the object is to get rid of the subject for the time being, and the motion is made with a purpose of voting against it. *Cushing*. — To beg the *question*. 2. The faculty or capacity of the human mind by which it is distinguished from the intelligence of the inferior animals; the higher as distinguished from the lower cognitive faculties, sense, imagination, and memory, and in contrast to the feelings and desires. Specifically, it is the intuitive faculty, or the faculty of first truths, as distinguished from the understanding, which is called the *discursive* or *ratiocinative* faculty.

We have no other faculties of perceiving or knowing anything divine or human, but by our five senses and our reason. P. Browne.

Syn. — Argumentation; argument. — *REASONING*, ARGUMENTATION. Few words are more interchanged than these; and yet, technically, there is a difference between them. Reasoning is the broader term, including both deduction and induction. Argumentation denotes simply the former, and descends from the whole to some included part; while reasoning embraces also the latter, and ascends from the parts to a whole. See *INDUCTION*. Reasoning is occupied with ideas and their relations; argumentation has to do with the forms of logic. A thesis is set down; you attack, I defend it; you insist, I reply; you deny, I prove; you distinguish, I destroy your distinctions; my reply balance or overturn your objections. Such is argumentation. It supposes that there are two sides, and that both agree to the same rules. Reasoning, on the other hand, is often a natural process, by which we form, from the general analogy of nature, or special presumptions in the case, conclusions which have greater or less degrees of force, and which may be strengthened or weakened by subsequent experience.

Syn.—Reform; amendment; correction; rectification. — **REFORMATION, REFORM.** *Reformation* is a more thorough and comprehensive change than *reform*. It is applied to subjects that are more important, and results in changes which are more lasting. A *reformation* involves, and is followed by, many particular reforms. "The pagan converts mention this great *reformation* of those who had been the greatest sinners, with that sudden and surprising change which the Christian religion made in the lives of the most profligate." Addison. "A variety of schemes, founded in visionary and impracticable ideas of reform, were suddenly produced." Pitt.

Also, in a more restricted sense, of those who separated from Luther on the doctrine of consubstantiation, etc., and carried the Reformation, as they claimed, to a higher point. The Protestant churches founded by them in Switzerland, France, Holland, and part of Germany, were called the *Reformed churches*. The town was one of the strongholds of the *Reformed faith*.

2. To break the natural course of, as rays of light or heat, when passing from one transparent medium to another of different density; to cause to deviate from a direct course by an action distinct from reflection; as, a dense medium *refracts* the rays of light as they pass into it from a rare medium.

3. (*Astron.*) (a) The change in the direction of a ray of light, and, consequently, in the apparent position of a heavenly body from which it emanates, arising from its passage through the earth's atmosphere; — hence distinguished as *atmospheric refraction*, or *astronomical refraction*. (b) The correction which is

to be deducted from the apparent altitude of a heavenly body on account of atmospheric refraction, in order to obtain the true altitude.

Angle of refraction (*Opt.*), the angle which a refracted ray makes with the perpendicular to the surface separating the two media traversed by the ray. — **General refraction** (*Opt.*), the refraction of a ray of light into an infinite number of rays, forming a hollow cone. This occurs when a ray of light is passed through crystals of some substances, under certain circumstances. Conical refraction is of two kinds: *external conical refraction*, in which the ray issues from the crystal in the form of a cone, the vertex of which is at the point of emergence; and *internal conical refraction*, in which the ray is changed into the form of a cone on entering the crystal, from which it issues in the form of a hollow cylinder. This singular phenomenon was first discovered by Sir W. R. Hamilton by mathematical reasoning alone, unaided by experiment. — **Differential refraction** (*Astron.*), the change of the apparent place of one object relative to a second object near it, due to refraction; also, the correction required to be made to the observed relative places of the two bodies. — **Double refraction** (*Opt.*), the refraction of light in two directions, which produces two distinct images. The power of double refraction is possessed by all crystals except those of the isometric system. A uniaxial crystal is said to be of the *rhombic* (like quartz), or *optically negative* (like calcite), or to have *positive*, or *negative*, double refraction, according as the optic axis is the axis of least or greatest elasticity for light; a biaxial crystal is similarly designated when the same relation holds for the acute bisectrix. — **Index of refraction.** See under INDEX. — **Refraction circle** (*Opt.*), an instrument provided with a graduated circle for the measurement of refraction. — **Refraction of latitude, longitude, declination, right ascension, etc.**, the change in the apparent latitude, longitude, etc., of a heavenly body, due to the effect of atmospheric refraction. — **Terrestrial refraction**, the change in the apparent altitude of a distant point on or near the earth's surface, as the top of a mountain, arising from the passage of light from it to the eye through atmospheric strata of varying density.

Re-fract'ive (rē-frākt'iv), *a.* [Cf. F. *réfractif*. See REFRACT.] Serving or having power to refract, or turn from a direct course; pertaining to refraction; as, *refractive surfaces*; *refractive powers*.

Refractive index (*Opt.*) See *Index of refraction*, under INDEX. — **Absolute refractive index** (*Opt.*), the index of refraction of a substance when the ray passes into it from a vacuum. — **Relative refractive index** (of two media) (*Opt.*), the ratio of the sine of the angle of incidence to the sine of the angle of refraction for a ray passing out of one of the media into the other.

It is, etymologically, that reaction of the mind which we instinctively feel when we think ourselves wronged. Pride and selfishness are apt to aggravate this feeling until it changes into a criminal animosity; and this is now the more common signification of the term. Being founded in a sense of injury, this feeling is hard to be removed; and hence the expressions *bitter* or *implacable resentment*. See **ANGER**.
